

What is claimed is:

1. A fluid changer including a first passageway and a second passageway, a valve coupled to the first passageway, the valve permitting the fluid  
5 that flows through the first passageway to be provided to the second passageway upon actuation of the valve, and out of the fluid changer, the first passageway adapted to permit the passage of a pig through the first passageway.

2. The apparatus of claim 1 including sections, each section including a first passageway and a second passageway, each section further including  
10 a valve coupled to that section's first passageway, each valve permitting the fluid that flows through that section's first passageway to be provided to that section's second passageway upon actuation of that section's valve, and out of the fluid changer, each section's first passageway adapted to permit the passage of a pig through the first passageway.

3. The apparatus of claim 2 further including a circuit for supplying the fluid to fluid dispensing device, each valve providing the fluid that  
15 flows through its respective section's second passageway upon actuation of that section's valve, and out of the fluid changer to the circuit and the dispensing device.

4. The apparatus of claim 3 further including a pressure regulator, the pressure regulator oriented in the circuit between the fluid changer and the  
20 dispensing device.

5. The apparatus of claim 2 wherein each section comprises a separate module, the modules being selectively removably connectable together in a desired number to permit the selection of any of a desired number of fluids in the fluid  
25 changer.

6. The apparatus of claim 2 further including two second passageways, each section further including two valves coupled to that section's first passageway, each valve permitting the fluid that flows through that section's first passageway to be provided to a respective one of that section's second passageways  
30 upon actuation of that respective valve, and out of the fluid changer.

7. The apparatus of claim 6 further including two circuits for supplying the fluids transported through the two second passageways to two fluid

For Filing Only

dispensing devices, each valve providing the fluid that flows through its respective one of its respective section's second passageways upon actuation of that respective valve, and out of the fluid changer to a respective one of the circuits and to a respective dispensing device.

5                   8.       The apparatus of claim 7 further including a pressure regulator oriented in each circuit between the fluid changer and that circuit's respective dispensing device.

                  9.       The apparatus of claim 6 further including valve means for switching between supplying the fluids transported through the two second  
10       passageways to the fluid dispensing device, the valve means providing the fluid that flows through a selected one of the second passageways to the dispensing device.

                  10.       The apparatus of claim 9 further including a pressure regulator oriented in the circuit between the valve means and the dispensing device.

                  11.       The apparatus of claim 2 wherein the fluid changer includes a  
15       coating material color changer for selecting among a number of colors of coating material to be supplied to an output port of the color changer.

                  12.       The apparatus of claim 3 wherein each section comprises a separate module, the modules being selectively removably connectable together in a desired number to permit the selection of any of a desired number of fluids in the fluid  
20       changer.
